

Tuesday

PRIORITY

09.00 After seeing: fire $\rightarrow$ heat, fire $\rightarrow$ heat, fire $\rightarrow$ heat
 the mind forms expectation: fire produces heat. That expectation
 10.00 feels like "necessity."

11.00 But logically: ① the next fire might not produce heat ② nothing in
 12.00 observation guarantees it must.

13.00 3. Why this is fascinating

14.00 Because it changes what science is doing.

15.00 Science is not: "seeing causes."

16.00 Science is: building methods to infer causes reliably. V. Imp

17.00 That's why: experiments, controls, statistics, RCTs exist.

18.00 They are tools to approach something we never directly perceive.

19.00 a) If causation is never directly observed, then why do we feel so strongly "this caused that"? Where does that feeling of necessity come from?

1. Habit/psychology (Hume's own answer)

After repeated patterns: 1) fire $\rightarrow$ heat

2) push $\rightarrow$ movement, the mind forms expectation.
