

Saturday

PRIORITY

09.00 Then any difference is likely caused by temperature.

10.00 Step 4: Observational vs experimental data

- 11.00 • Big debate: Are experiments the only way to infer causation?
- Some say: yes.
- 12.00 • Others say: statistical analysis of observational data can also reveal causes.
- Still debated.

14.00 Step 5: Randomized Controlled Trials (RCTs)

- 15.00 • Gold standard in medicine
- 16.00 • Example: Testing a drug.
 - patients randomly divided into two groups.
 - one gets drug, one doesn't
- 17.00 • Randomization matters because: 1) it prevents hidden biases
- 18.00 2) ensures other factors are evenly spread
- 19.00 • So differences likely come from the drug.

11 Sunday

Step 6: But RCTs are not everything

- sometimes experiments are impossible or unethical.
- yet we still infer causes.
